

Typography

IBM Plex Sans is set with a variant of the 1.250 Major Third Type Scale chart. The typographic scale is an ordered set of character sizes linked to each other by a common ratio. A modular scale is essential for us to create consistency, harmony, and contrast. We are using 16px as our base.

This medium scale is great for it's clear hierarchy and versatility, giving us the ability to use these styles for both mobile and desktop if needed.

Caption and overline text are the smallest font sizes. They are used sparingly to define imagery or to introduce a headline.

Overrides: Any of these styles can be left, centered or right aligned (showing left only). Colors listed below are the only colors secured for text due to accessibility.
